## Mounting of sensor

The sensor must be fully immersed in the media to have accurate switching and reproducible response times.
The capillary tube should not be immersed in media.
Thermal effects on the capillary tube will affect the switching point.

## Adjustment of switch point

1. Immerse sensor in calibrated bath or dry block.

Set environmental conditions for capillary tube similar to target application.
2. Wait approx. 1 hour to ensure constant condition of sensor, capillary tube and housing.
3. Adjust switchpoint (release switchpoint locking befor adjusting). Increasing switchpoint: slowly turn set point screw clockwise from lower to higher temperatures until the microswitch clicks.
Decreasing switchpoint: slowly turn set point screw counter-clockwise from higher to lower temperatures until the microswitch clicks.
4. In case the indicated temperature on the dial differs too much from the set temperature, the dial can be adjusted according page 3 of this instruction. (online version only, www.trafag.com/H73111)

## Release of switchpoint locking

To adjust the switch point, the switchpoint locking must be released before turning the set point screw. After completing the adjustment, the switchpoint must be locked again.

## Adjustable switching differential

The differential can be set by turning the knurled knob on the operating lever. The knurled knob is equipped with a scale. Turning to the left (direction of arrow + ) increases the differential. Turning to right (direction of arrow -) decreases the differential. The adjustment of the differential only affects the lower switchpoint, the upper switch point remains unchanged.

Adjustment of switchpoint indicator scale

## Instruments with internal setpoint adjustment

Instruments with external setpoint adjustment

1. Release the setpoint knob

2. Adjust the scale based on a reference temperature

3. Fix the setpoint know again
